

## **1. AUTOMATION OF NIRA NATIONAL ID REGISTRATION.**

The registration process is really complicated and long, you go there, there are very many people there, it's basically frustrating so I thought about automating this whole issue, what if people could register online conveniently.....

### **DRAWBACKS.**

We need to capture fingerprints and I don't know how easy including biometric is.

## **2. JOB MATCHING AND SEARCHING.**

I thought about eliminating AI from this because man we might suffer there and again, I was thinking, and we could actually do the recommendations things without AI.

this will consist of two sides. The employer and the employee, the employer posts the jobs and all that shit, the employees create profiles on this web app uploading their resumes such that when an employee is looking for someone to hire, he can come here and look through peoples profiles in a particular category let's say SOFTWARE DEVELOPERS ,etc. then the employees, they could find the posted jobs and apply.

then recommendation, we can filter basing on what the logged in user is in line with and display those and when jobs are uploaded that are in line with a user's category, they get a notification. For example, if you are an accountant, when an accounting job has been uploaded, you get an email such that you can check it out.

these are just the basic functionalities of the application, but more can be added. Am not really sure if they are going to allow doing just a web application without some machine learning or emebdedded.

So bro, these are my ideas for now, I don't know what you think about them.
